4 silage bales
in 90 seconds

Silotrans

bale transporter

VIDEO
www.mammut.at

Silo Trans is a trailer for the reception and storage of four silage bales in an incredible 90 seconds. Whether pressed or wrapped bales, they are picked up very gently and then carried away. In the transport position the weight is directly over the axle, thereby ensuring ideal drivability, regardless of on or off road. Of course, an extra bale can be transported on the front hydraulics.

For this, simply a 70 hp tractor is required – that is the most efficient solution for bale transportation with a classic grassland tractor!

ingenious idea – and sooo easy!

With a pivotal point above the shaft the lifting forks are put down to the ground. By the use of a bracket at the forks on the backside and by a pipe on the front-forks they grab totally into each other. So they can both be put down to the ground. You drive backward to the bale, so that you can have a look below the bale at second fork.

Now the second bale can be lifted in the same way.

Due to 2 separate, double-functioning hydraulic control-circuits this process can be arranged independent from each other at the left and the right side. So it is possible to collect 4 silage bales within about 1,5 minutes.

technical details

height in transport position	2.300 mm
width	from 2.480 mm
length	5.200 mm
weight	1.500 kg
power requirement	from 70 PS
standard tyres	355/60-18

5 silage bales
instead of 1
